### **About Us:**

Base Pair Biotechnologies offers its customers a total solution for developing novel aptamer-based technologies. We support companies developing products ranging from: basic research detection, to clinical diagnostics, to therapeutic lead development. Our platform technology is a patent pending, multiplexed approach to aptamer discovery. This allows us to offer de novo aptamer discovery services at unprecedented speed and throughput. Besides our custom work we have hundreds of aptamers on hand with various degrees of prior validation. For these aptamers we are seeking research partners for joint publication and "beta-testing" or they can be used for proof of principle experiments. Scientists at Base Pair Biotechnologies have been studying aptamers and developing them on a research basis since 2004.
