---

Hoods designed for both chemical and particulate protection over a broad range of laboratory and industrial applications.

Development of the Purair ECO is in response to an increasing worldwide demand for safe, cost-effective and energy-efficient ductless containment cabinets that minimize stress on facility HVAC systems without compromising protection for personnel and the environment.

The ductless fume hood is available with a choice of controllers including the company's new ECOair touchpad control with color display interface.

An optional BACnet network interface connects all cabinet control, monitoring and alarm functions to an open-source facility monitoring system. The system is based on an industry-wide, non-proprietary ASHRAE compliant protocol for green building management.

The fume hood is available in five standard sizes from 30" wide to 69" wide.
